

NICK CINERA

Trading Systems Engineer | High-Performance UI, Real-Time Data & Distributed Systems

New York, NY | 386-212-8631 | nicolas.cinera@gmail.com | linkedin.com/in/nickcinera | github.com/Extrieve

Software engineer at Goldman Sachs building latency-sensitive equity-derivatives and capital-markets platforms used by traders and deal teams. Owns React/TypeScript/AG Grid interfaces through Java/WebSocket services and production rollout, with deep experience in real-time state, large data grids, event-driven architecture, and controlled migration of desk-critical workflows.

TECHNICAL EXPERTISE

Frontend: React, TypeScript, JavaScript, Redux Toolkit, redux-observable/RxJS, AG Grid Enterprise, Module Federation, Cypress, Jest, Karma/Jasmine

Real-Time & Backend: Java, WebSocket, REST APIs, Node.js, Python, SQL, event-driven/distributed systems, normalized and denormalized projections

Trading & Delivery: Equity derivatives RFQ/RFS, DCM new issuance, pricing grids, P&L/fees, CI/CD, LaunchDarkly, canary rollouts, production hardening

AI-Accelerated Engineering: Agentic coding systems, repo-aware code generation, debugging and refactoring, test design, and review workflows grounded in builds, tests, and human validation

EXPERIENCE

Goldman Sachs - Software Engineer, Global Markets - Equities | New York, NY Apr 2025 - Present

- Own end-to-end delivery of a real-time, multi-leg pricing grid used by equity-derivatives traders to price and structure RFQ/RFS inquiries, spanning the React/TypeScript/AG Grid UI, Java pricing and streaming tier, WebSocket protocol, and release configuration.
- Led the incremental migration of a legacy client-heavy pricer to a server-authoritative, event-driven architecture; used a feature canary and parallel old/new-path validation to protect trader workflows while establishing parity and retiring legacy paths.
- Designed a server-computed layout model that streams tabs, columns, nested per-leg grids, expansion state, styling, formatting, and cell-renderer metadata, keeping the browser focused on fast rendering and interaction rather than layout computation.
- Built normalized and denormalized projections from a shared domain model and diff-based WebSocket publishing, sending only changed structure and removing redundant per-event fields to reduce payload churn on a latency-sensitive path.
- Delivered approximately 100 tracked work items across UI, Java services, and release configuration in 12 months, including 188 commits on the pricing-grid/data layer and 35 of 38 server-tier commits in the core pricing engine.
- Use AI-assisted and agentic engineering workflows for repository-scale navigation, implementation planning, debugging, refactor decomposition, test design, and review, validating outputs against local builds, specifications, and production constraints.

Goldman Sachs - Software Engineer, Investment Banking - Debt Capital Markets | New York, NY Feb 2023 - Apr 2025

- Owned two production capital-markets applications used daily for bond and loan new-issue workflows, from investor targeting and demand aggregation through pricing, allocation, trade booking, and P&L/fee reconciliation.
- Built dense, keyboard-driven React/TypeScript and AG Grid workflows across Redux Toolkit/Module Federation and Redux/redux-observable (RxJS), integrating real-time updates and domain REST services.
- Operated an investor-analytics platform as a Module Federation host, loading remote applications through runtime-injected origins across development, QA, and production while keeping shared React/Redux dependencies singleton-safe.
- Created a reusable cross-tab grid-preferences and export framework that persisted each user's column order, visibility, widths, pinning, and reorder rules while keeping CSV/Excel output aligned with the on-screen layout.
- Delivered P&L/fee editing and investor-participation workflows end-to-end, including tab-and-enter navigation, dirty-state cues, precision rules, multi-currency aggregation, API integration, authorization gating, and export parity.
- Managed a versioned Funds Flow UI package integration through branch-conditional CI install rules, allowing integration testing against candidate upstream releases without destabilizing production release branches.
- Modernized both platforms through React 17-to-18 and AG Grid 23-to-30 migrations, node-sass removal, LaunchDarkly/UI toolkit/Node upgrades, Module Federation release configuration, and partner-package integration across managed CI/CD pipelines.

Goldman Sachs - Software Engineer Intern | Dallas, TX Jun 2022 - Aug 2022

- Earned a return offer after building production engineering experience in a regulated financial-services environment.

EDUCATION, LEADERSHIP & CREDENTIALS

University of South Florida - M.S., Computer & Information Systems (Machine Learning) Dec 2022

- Technical Chairman, USF Society of Competitive Programmers - prepared and coached students for ICPC competitions, teaching data structures, algorithms, complexity analysis, correctness, and systematic problem solving under time constraints.
- Oracle Certified Professional, Java SE 8 Programmer II; Oracle Certified Associate, Java SE 8 Programmer | Bilingual English/Spanish
